

**+** Joint Solution by Aladdin and Mobility Office Solutions AG

**PKI All-In-One Solution**

**Introduction**

Mobility Office Solutions AG is a Munich based application service provider that is targeting the enterprise market with a flexible USB based desktop deployment and management solution. In essence, the company delivers business critical applications via the global network employing USB-drives as receiving front-end devices. The use of portable USB devices for software deployment enables users to carry along their virtual desktop at all times and to run it on any Windows 2000, XP, or Vista-PC as a subsystem without previous installation (Mobility's Plug&Work principle). Besides significantly improving a workforce's flexibility, the solution also allows for a resource efficient centralized management of remote workspaces and dynamic user groups, by identifying and controlling the portable USB client devices, rather than the host-PCs they are used with. Key component of this solution is the MobilityOffice client software. This software allows applications to be installed and executed on and from a USB device. It also makes almost any USB storage media identifiable to Mobility's back-end thus ready to use with their innovative deployment platform.

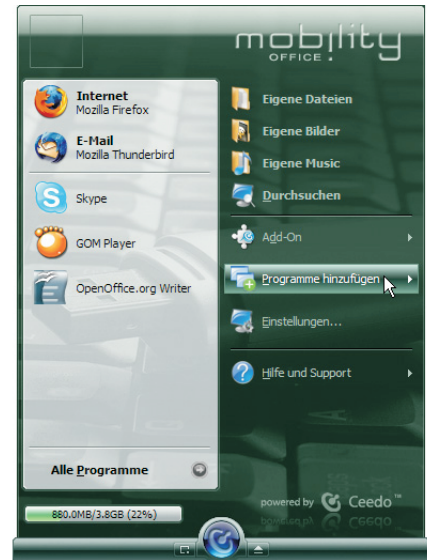

**Technology Convergence**

By integrating Mobility's client software with the Aladdin NG Flash a synergetic all-in-one solution is created that allows for a single USB device to provide both the authentication tools and the application environment relevant to a security-sensitive task. The Aladdin e-Token software can be installed on the NG Flash itself, rather than on a stationary PC, making the solution completely system-independent. Users are thereby able to execute their very personal secure workspace on any Windows-PC as an encapsulated subsystem simply by connecting the NG Flash to the USB port. Despite its flexibility, the solution is fully centrally manageable.

The system integration is straight forward and is achieved by copying the MobilityOffice software image to the NG Flash. The standard or trial version of the MobilityOffice client software comes with a basic business software suite that can be individualized by the user using an associated program directory with more than 100 additional applications. On demand, the standard version can easily be upgraded and customized to specific needs of enterprises and organizations - including the virtualization and provision of corporate software, program pre-configurations, restrictive settings, individualization of the graphical interface, etc...

## Key Benefits

- **all-in-one solution**  
authentication tools as well as applications relevant to a security-sensitive task are provided by a single USB-device
- **turnkey ready**  
enterprises and organizations are able to hand out preconfigured turnkey ready solutions, freeing their users from program installation or configuration procedures
- **highly mobile and flexible**  
the e-Token software is installed on the NG Flash within the MobilityOffice virtual application environment that can be executed on any Windows 2000, XP, or Vista-PC simply by plugging the NG Flash into the USB port (guest rights are sufficient)
- **improved security**  
the secure workspace runs as an isolated subsystem, leaving no traces of sensitive information on the host-PC
- **adaptable and scalable**  
the solution is easily adaptable to any needs and scenarios
- **fully centrally manageable**  
enterprises and organisations have full centralized control over the remote workspaces that are used to access their resources (user management, endpoint-lockdown, on demand software deployment, forced updates...)

The virtual application environment is accessed and managed via the **easy access menu** - the graphical interface of the MobilityOffice client software

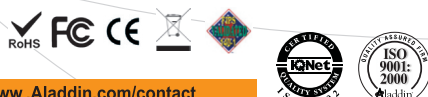

By installing the MobilityOffice client software on the NG Flash, a portable and secure virtual workstation is created that can be deployed on any Windows 2000, XP, or Vista-PC - Plug&Work

## About Aladdin

Aladdin Knowledge Systems (NASDAQ: ALDN) is an information security leader with offices in 15 countries, a worldwide network of channel partners, and numerous awards for innovation. Aladdin eToken is the world's #1 USB-based authentication solution, offering identity and access management tools that protect sensitive data. Aladdin SafeWord OTP-based two-factor authentication technology protects companies' important information assets and applications.

Aladdin HASP SRM boosts growth for software developers and publishers through strong anti-piracy protection, IP protection, and secure licensing and product activation. Aladdin eSafe delivers real-time intelligent Web gateway security that helps protect data and networks, improves productivity, and enables compliance.
